Assumptions behind this plan

Primary buyer is the broker/dealer, not the developer. Team of 2 developers, 6-week window. Database is PostgreSQL (the model uses PostGIS and jsonb). Pricing shows "Free during beta" until real prices are set. Change any of these and the timing shifts, not the order.

All tasks | Open only | Launch blockers | Copy as Markdown | Clear ticks

Phase 0 Decide before building

This week

Two decisions that change what everything else means. Make them first so nobody builds the wrong thing.

Commit to one primary buyer

Launch blocker

Write one sentence: who pays, how many staff, what they do daily. Default chosen here: brokers/dealers with 2–15 staff. Developers become a later Premium segment.

Done when: The sentence is on the landing page and in the repo README.

Freeze phase-2 modules

Mark construction/IPC, consolidation, budget control, procurement & stock, full HR attendance and tax returns as phase 2+. Tag them in the data-model viewer so nobody picks them up early.

Done when: Viewer shows an MVP vs phase-2 badge on every module.

Phase 1 Fix the schema

Weeks 1–2

Cheap now, expensive after the first real customer. Several of these break the moment a

second tenant signs up.

- [ ] **Scope every unique constraint to the tenant** Launch blocker

  Change single-column UKs to `(company_id, …)` on `gl_accounts.code`, `properties.code`, `vouchers.number`, `receipts.receipt_no`, `bookings.booking_no`, `tax_codes.code`, `property_types.code`, `departments.name`, `employees.employee_no`, `fiscal_years.name`, `accounting_periods.start_date` and the rest of the per-company codes.

  Done when: A test creates two companies with an identical chart of accounts and periods without errors.

- [ ] **Add company_id to document_sequences key** Launch blocker

  PK becomes `(company_id, doc_type, period_key)`. Take the next number with `SELECT … FOR UPDATE` inside the posting transaction.

  Done when: Two tenants posting receipts at the same moment get independent, gapless numbers.

- [ ] **Fix CNIC uniqueness** Launch blocker

  Drop the UK on encrypted `parties.cnic`. Store `cnic_hash` as a keyed HMAC and make `(company_id, cnic_hash)` unique.

  Done when: The same CNIC can exist at two dealers but not twice at one.

- [ ] **Make double-booking a plot impossible** Launch blocker

  Partial unique index on `bookings(property_id) WHERE status IN ('pending','confirmed')`. Lock the property row and update `properties.status` in the same transaction as the booking insert; check `property_holds` there too.

  Done when: A concurrency test with two simultaneous bookings on one plot leaves exactly one.

- [ ] **Block cross-tenant references** Launch blocker

  Use composite FKs on `(company_id, id)` for tenant tables and add Postgres RLS policies keyed on a session setting such as `app.company_id`.

  Done when: A booking cannot reference another company's property, even through raw SQL as the app role.

- [ ] **Adopt an audit-column convention**

  Every table gets `created_at`, `updated_at`, `created_by`. Mutable master data gets `version` for optimistic locking and `deleted_at` for archiving. Financial documents are never soft-deleted, only voided or reversed.

  Done when: Convention written in the schema doc and enforced by a migration lint.

- [ ] **Set one source of truth for derived values**

  Installment paid/status comes from `receipt_allocations` (trigger or view). Voiding a receipt reverses its allocations. Same rule written for `bookings.net_price`, `budgets.total_amount` and `leads.stage`.

  Done when: Voiding a receipt in a test returns the installment to due/partial.

- [ ] **Type the references on money tables**

  Replace untyped `ref_id` / `doc_id` / `source_id` on `combined_transaction_items`, `document_taxes` and `budget_commitments` with nullable typed FKs plus a check that exactly one is set. Keep polymorphic links for comments, tags and files.

  Done when: No financial row can point at a missing document.

- [ ] **Clean up tenancy and roles**

  Add a `branches` table under a company. Collapse to one role system. Either add a `teams` table or remove the 'team' data scope.

  Done when: "Multi-branch" on the pricing page maps to a real table.

- [ ] **Write the state machines**

  Allowed transitions for property, booking, cheque, installment and the new deal entity, with who can trigger each.

  Done when: Diagrams in the repo, and the API rejects illegal transitions.

Phase 2 Build the dealer core

Weeks 3–6

This is the workflow a broker opens every day and the reason they would pay.

- [ ] **Add the brokered deal (sauda)** Launch blocker

  New `deals` table: seller party, buyer party, property or listing, token/bayana amount and date, agreement-to-sell deadline, forfeiture terms, stage (token → agreement → transfer → closed / cancelled).

  Done when: A dealer can record a token, see the deadline, and close or cancel the deal.

- [ ] **Track commission as income** Launch blocker

  `deal_commissions` receivable from buyer and/or seller, with splits to internal agents and co-broking dealers. Posts to the ledger through `posting_rules`.

  Done when: Monthly commission earned and outstanding shows on the dashboard.

- [ ] **Capture lead requirements and match inventory**

  Add wanted type, size range, areas/societies, purpose and timeline to `leads`. Build a matching view against available listings.

  Done when: Opening a lead shows the listings that fit it.

- [ ] **Deduplicate leads by phone**

  Unique `(company_id, phone_e164)` for open leads, with a merge flow for imports from Facebook, WhatsApp and Zameen.

  Done when: Importing the same number twice merges instead of duplicating.

- [ ] **Send WhatsApp reminders for tokens and installments**

  Use the existing templates and `outbound_messages`: token deadline, installment due, cheque date approaching.

  Done when: Reminders send from a scheduled job with delivery status logged.

- [ ] **Cut the MVP table list**

  Target roughly 40–60 tables: platform, parties, property core/location/dimensions/media, CRM, deals, bookings, installments, receipts, PDCs, a simple ledger, messaging.

  Done when: Migrations contain only MVP tables; the rest live in a separate phase-2 folder.

Phase 3 Fix the public site

Week 2, in parallel

Quick wins. Right now the first impression reads as unfinished.

- [ ] **Replace "Rs 0/month"** Launch blocker Quick win

  Show "Free during beta" on every tier until real prices are set, on both the landing page and the billing settings page.

  Done when: No zero prices anywhere on the site.

- [ ] **Server-render the counters** Quick win

  "0 Subscription tiers" and "0+ modules" appear before JavaScript runs and in WhatsApp/Facebook link previews. Render the final numbers in HTML and animate from there.

  Done when: Fetching the page without JS shows the real numbers.

- [ ] **Stop the dashboard showing zeros on first paint** Quick win

  Use skeletons until data loads, instead of "Rs 0 collected, 0%".

  Done when: Slow-network load shows skeletons, never false zeros.

- [ ] **Rewrite positioning for dealers**

  One headline aimed at brokers. Remove "for developers" from Premium or move it to a separate developer page.

  Done when: Every tier description speaks to the same buyer.

- [ ] **Re-gate tiers around dealer income**

  Move commission tracking and WhatsApp reminders into Basic or Moderate. Keep plot map, consolidation and white-label in Premium.

  Done when: Pricing table updated and the in-app plan gates match it.

- [ ] **Add local trust signals** Quick win

  WhatsApp contact button, visible Urdu toggle, a mobile screenshot of the app.

  Done when: All three visible above the fold on mobile.

- [ ] **Hide modules outside the user's plan**

  Today the sidebar shows about 28 items. Show only what the plan includes, with one "More features" entry for upgrades.

  Done when: A Basic user sees 10 or fewer sidebar items.

Phase 4 Validate with real dealers

Weeks 4–6

Decides what phase 2 actually contains, based on evidence instead of a module count.

- [ ] **Recruit 5–10 dealers**

  Mix of solo brokers and small agencies, ideally across two cities.

  Done when: Sessions booked.

- [ ] **Run task-based sessions**

  Ask each dealer to record a token, add a buyer lead, post an installment and find a matching plot. Watch, don't demo.

  Done when: Notes for each session in one shared doc.

- [ ] **Rank screens by real use**

  List the 5 screens dealers needed most and the features they asked about that you don't have (file trading is the one to listen for).

  Done when: Ranked list decides the phase-2 backlog.

- [ ] **Ask about price**

  End every session with what they pay today (register, munshi, other software) and what they would pay for this.

  Done when: Real tier prices replace "Free during beta".

Built from the PropIQ data model (227 tables, 15 modules) and the public prototype as of 8 Oct 2026.
